RE: Staff Software Engineer - Full Stack, Okta Workflows Builder Platform

Dear Hiring Team,

I am writing to apply for the Staff Software Engineer, Full Stack role on the Okta Workflows Builder Platform team. The combination of design-time UX, backend services, product collaboration, and platform reliability is exactly the kind of full-stack work I enjoy most. I am especially interested in helping make a complex automation product feel intuitive, fast, and dependable for the people building on it.

At RBC, I led the 0-to-1 delivery of a Node.js, TypeScript, and React platform with reusable workflows and real-time data rendering. That work required building both the user-facing experience and the underlying service patterns that kept the product secure and maintainable. I also helped build reusable implementation guidance and onboarding material so internal teams could adopt new capabilities more easily, which maps well to the kind of builder experience Workflows depends on.

I also bring hands-on experience from HealthCard, where I was the first engineer and built a cloud-native product from scratch on AWS EKS, including a React frontend, Node.js API, and audit logging. That role taught me how to move from ambiguous product ideas to working software quickly, how to make good tradeoffs across UI, API, and infrastructure, and how to keep momentum high while still holding the bar for quality.

What attracts me to this role is the chance to work closely with Product, Design, and Architecture while owning features end to end. I like the craft side of engineering: testing, documentation, scalability, and the details that make a platform pleasant to use. I also embrace AI-assisted development tools as part of my workflow, using them to accelerate delivery while maintaining judgment and rigor.

I would welcome the opportunity to bring that mindset to Okta Workflows and help shape the next generation of the builder experience. Thank you for your consideration, and I would be glad to discuss how my background in React, Node.js, cloud delivery, and platform engineering maps to the team's goals.

Best regards,

Dhruv Doshi
