RE: Senior Staff Software Engineer – International Card Tech – Full-stack

Dear Capital One Canada Hiring Team,

I am excited to apply for the Senior Staff Software Engineer role with International Card Tech in Toronto. The opportunity brings together the work I do best: creating secure, scalable architectures in a regulated financial environment, translating business goals into sound technology decisions, remaining hands-on across the full stack, and helping engineering teams adopt consistent design and delivery practices.

In my current role as Staff Software Developer and Enterprise Architect at RBC, I work within the Enterprise Architecture group to shape solution designs throughout their lifecycles. I partner with engineering, product, risk, security, infrastructure, and senior architecture stakeholders to define target states, review high-level designs, document architectural decisions, select security and integration patterns, and guide solutions through certification. This experience has taught me how to preserve architectural integrity while keeping delivery practical and connected to business value.

I also bring deep hands-on product engineering experience. I designed and led the 0-to-1 production delivery of a patent-pending enterprise architecture blueprint platform using Node.js, TypeScript, React, and REST APIs. Its rules-based recommendation and auto-certification workflows map more than 1,000 architecture patterns to compliant component selections. In parallel, I digitalised RBC's technical reference model, cataloguing more than 1,000 technologies and 1,500 capabilities with ownership and standards metadata to improve governance, modernization planning, and business-technology alignment.

My architecture work spans cloud-native and high-scale distributed systems. I architected an OpenTelemetry-based telemetry platform using Vector, Fluent Bit, Kafka, and Logstash that ingests 150 TB per day across more than 10,000 systems. The design replaced point-to-point vendor integrations with standardized, auditable pipelines and made telemetry routing a configuration decision. Earlier, as the first full-stack engineer at HealthCard, I built React/TypeScript interfaces, Node.js APIs, verification workflows, and an AWS EKS deployment with HIPAA-aligned audit controls. Together, these experiences have strengthened my judgment around security, privacy, resiliency, APIs, microservices, containers, and public-cloud implementation.

Leadership is inseparable from the technical work for me. I lead five engineers through sprint delivery, code and design reviews, ADRs, mentoring, and executive-ready demonstrations, while building alignment across teams with different priorities and levels of technical depth. Capital One Canada's commitment to cloud adoption, open source, RESTful APIs, microservices, and customer-focused innovation is especially compelling, and I would welcome the opportunity to help shape the architecture behind its international card experiences.

Thank you for your consideration. I would be glad to discuss how my combination of financial-services architecture, full-stack engineering, cloud platform design, governance, and technical leadership can contribute to Capital One Canada.

Best regards,
Dhruv Doshi
