RE: Machine Learning Specialist, DRW

Dear Hiring Team,

I am writing to apply for the Machine Learning Specialist role at DRW in Montreal. The position is compelling because it focuses on the part of machine learning that I care about most: building reliable systems around models so research can become production software. DRW's environment of autonomy, high expectations, and close collaboration between machine learning, data, and software professionals is a strong match for my background in AI systems, MLOps, observability, and distributed software delivery.

At RBC, I am building ASB Assist, an LLM + RAG system on top of an enterprise architecture platform. The system includes retrieval pipelines, context assembly, prompt/version comparison, citation validation, audit trails, guardrails, and offline evaluation workflows before production rollout. This work maps directly to DRW's need for scalable, reproducible ML tooling that supports validation, deployment, monitoring, and continuous improvement of model behavior.

I also architected RBC's institution-wide telemetry platform using OpenTelemetry, Vector, Fluent Bit, Kafka, and Logstash, ingesting 150 TB/day across 10,000+ systems. That platform standardised schemas and pipelines for model monitoring, drift signals, anomaly detection, latency SLOs, alerting, and production debugging. It gave me practical experience building the infrastructure ML teams need around serving systems: reliable signals, traceability, operational visibility, and feedback loops for improving deployed models.

Earlier, as the first engineer at HealthCard, I integrated transformer-based document classification into healthcare and insurance workflows and deployed inference APIs on AWS EKS with monitoring, audit logging, and production feedback loops. I also designed validation and trust-score workflows for real-time premium verification and fraud-resistant claims processing. Across these projects, I have combined Python, TypeScript, Go, distributed data systems, Docker/Kubernetes, testing, and production ownership to move complex systems from prototype to durable operation.

I would welcome the opportunity to bring this experience to DRW's machine learning team: building feature and model pipelines, improving model validation and monitoring, optimizing serving reliability, and helping create frameworks that make research more scalable and reproducible. Thank you for your consideration, and I would be glad to discuss how my background can support DRW's high-impact ML systems.

Best regards,

Dhruv Doshi
