**RE: Senior Backend Principal Developer Vice President, Citi**

Dear Citi Hiring Team,

I am writing to apply for the Senior Backend Principal Developer Vice President role (Job Req ID 26975065) in Mississauga. I bring six years of software engineering experience across financial services, government, and an acquired startup, together with current responsibility as a Staff Software Developer and Enterprise Architect at RBC. The opportunity to own the backend architecture of a secure, federated digital platform is a strong match for my experience combining hands-on delivery, distributed-systems design, identity architecture, and technical leadership in regulated environments.

At RBC, I designed and led the 0-to-1 production delivery of a patent-pending enterprise architecture blueprint platform using Node.js, TypeScript, React, and REST APIs. Its rules-based recommendation and auto-certification engine maps more than 1,000 security, integration, and infrastructure patterns to compliant enterprise services. I govern IAM, SSO, OAuth, gateway, Zero-Trust, and HTTPS integration patterns across AWS, GCP, OCP/Kubernetes, and on-prem environments, partnering with engineering, product, infrastructure, security, and risk teams to turn complex requirements into maintainable end-to-end solutions.

My work also includes high-throughput, fault-tolerant backend systems. I architected an OpenTelemetry-based telemetry platform using Vector, Fluent Bit, Kafka, and Logstash that ingests 150 TB per day across more than 10,000 systems. The platform standardizes schemas, resilient routing, replayable ingestion, and vendor-independent integrations while supporting SLOs, alerting, incident triage, and root-cause analysis. This experience has given me practical judgment around asynchronous processing, caching, data-access patterns, observability, and failure containment at enterprise scale.

I complement that production architecture background with hands-on Java work, including a Spring Boot federated identity gateway prototype implementing OAuth 2.0/OIDC flows, token validation, centralized entitlements, policy-based authorization, Redis caching, audit logging, and service-to-service APIs. Earlier, I modernized a Java/Apache Struts federal tax platform at the Canada Revenue Agency and, as HealthCard's first engineer, built Node.js APIs and AWS EKS services with HIPAA-aligned controls. These projects span relational and NoSQL data, Docker/Kubernetes delivery, secure API design, and front-end integration.

I currently lead five engineers through code and design reviews, ADRs, testing expectations, mentoring, production-readiness decisions, and incident follow-through. I would welcome the opportunity to bring this combination of architectural ownership, hands-on backend engineering, identity and security depth, and operational discipline to Citi's digital experience platform. Thank you for your consideration; I would be glad to discuss how my experience can support the scale and reliability expected of this role.

Best regards,  
Dhruv Doshi
