RE: Staff Software Engineer, AI Platform

Dear EvenUp Hiring Team,

I am excited to apply for the Staff Software Engineer role on EvenUp's AI Platform team. The opportunity to build shared systems that make LLMs accessible, reliable, and scalable across an engineering organization closely matches my current work. EvenUp's mission is also compelling: applying document intelligence and production AI to make a high-stakes legal process more understandable, efficient, and fair for people who need leverage most.

At RBC, I am building ASB Assist, an LLM + RAG layer that turns natural-language business requirements into compliant architecture diagrams and enterprise service recommendations. The work spans retrieval, tool integration, prompt and context engineering, offline evaluation, grounding controls, citation validation, security, and auditability. It sits on top of ASB Builder, the deterministic platform I designed and led from 0-to-1 production delivery using Node.js, TypeScript, React, and REST APIs. Keeping those layers distinct has reinforced an important platform principle: use models where they create real leverage, while making the surrounding system observable, testable, and dependable.

My broader platform experience aligns with EvenUp's emphasis on resilient backend systems. I architected an OpenTelemetry-based data platform using Vector, Fluent Bit, Kafka, and Logstash that ingests 150 TB per day across more than 10,000 systems. It standardized schemas and vendor integrations for over 20 engineering teams and required careful decisions around throughput, failure handling, operability, developer enablement, and long-term maintainability. My recent prototypes also use Python/FastAPI, PostgreSQL/pgvector, Elasticsearch, Kubernetes, and React to build document-heavy RAG workflows with asynchronous ingestion, evaluations, tracing, tenant isolation, and human review.

I also bring direct experience with document intelligence in a mission-sensitive domain. As HealthCard's first full-stack engineer, I integrated transformer-based document classification into insurance and credential-verification workflows, with monitored inference APIs, trust scoring, and HIPAA-aligned audit trails. I built the broader product across React/TypeScript, Node.js services, and AWS EKS, and the team grew to more than 20 engineers before acquisition. That experience taught me how model behavior, backend design, data quality, and user outcomes meet in a production workflow.

At staff level, I lead five engineers and drive ambiguous initiatives from design through deployment and iteration. I translate high-level needs into execution plans, make architectural trade-offs explicit, review code and designs, define observability and reliability standards, mentor engineers, and influence platform roadmaps across Product, AI, Infrastructure, Risk, and Security stakeholders. I would bring that combination of hands-on backend delivery and force-multiplying technical leadership to EvenUp's AI Platform team.

Thank you for your consideration. I would welcome the opportunity to help EvenUp build the reliable AI infrastructure that enables product teams to move faster while maintaining the quality and safety required for legal workflows.

Best regards,
Dhruv Doshi
