RE: Staff Software Engineer, Ads Engineering (AI-Native), Life360

Dear Life360 Hiring Team,

I am excited to apply for the Staff Software Engineer, Ads Engineering (AI-Native) role. I bring six years of engineering experience across financial services, government, and an acquired startup, and I currently serve as a Staff Software Developer and Enterprise Architect at RBC. Life360's challenge—evolving a low-latency platform that processes billions of requests and events while integrating external partners—strongly matches my experience designing high-throughput distributed systems, setting technical direction, and remaining hands-on with backend delivery.

At RBC, I architected an OpenTelemetry event platform using Vector, Fluent Bit, Kafka, and Logstash that ingests 150 TB per day across more than 10,000 systems. I designed governed schemas, resilient routing, replayable ingestion, and vendor-independent integrations while establishing the SLO, alerting, incident-triage, and root-cause practices needed to operate the platform safely. That work required careful decisions around partitioning, backpressure, consistency, failure isolation, horizontal scaling, and capacity planning—the same engineering fundamentals that underpin a reliable ad server and exchange.

I also designed and led the 0-to-1 production delivery of a patent-pending backend platform whose rules engine maps more than 1,000 security, integration, and infrastructure patterns to compliant enterprise services. Across AWS, GCP, Kubernetes, and on-prem environments, I define patterns for asynchronous processing, caching, retries, circuit breakers, failover, identity, and observability. Earlier, as HealthCard's first engineer, I built transaction APIs and AWS EKS services from scratch, introduced automated delivery, and helped the organization scale to more than 20 engineers before acquisition.

To deepen my understanding of advertising systems, I built a Java/Spring Boot OpenRTB-style auction prototype featuring concurrent demand-partner fan-out, deadline-aware winner selection, Redis-backed frequency caps, circuit breakers, and OpenTelemetry instrumentation. It is a personal prototype rather than production AdTech experience, but it gave me practical exposure to auction mechanics and the latency-versus-yield trade-offs involved in partner integrations. My Java foundation also includes modernization work on a federal Java/Apache Struts platform serving millions of Canadians.

I currently lead five engineers through design and code reviews, ADRs, testing strategy, mentoring, and cross-functional decisions with product, security, infrastructure, risk, and architecture stakeholders. I use agentic LLM and RAG workflows as development collaborators while retaining full ownership of design quality and shipped code, and I am building AI-assisted architecture generation and validation capabilities. This combination of judgment, operational discipline, and AI-enabled execution would let me contribute to Life360's AI-native engineering culture while raising the reliability and delivery bar across Ads Engineering.

I would welcome the opportunity to discuss how my distributed-systems background, staff-level leadership, and hands-on platform experience can support Life360's next phase of monetization scale. Thank you for your consideration.

Best regards,
Dhruv Doshi
