RE: Staff Software Engineer, Web3

Dear Robinhood Hiring Team,

I am excited to apply for the Staff Software Engineer, Web3 role in Toronto. Robinhood's goal of making private and public assets available on-chain and tradable around the clock brings together the areas that have shaped my career: blockchain product engineering, financial systems, distributed platforms, security, and hands-on technical leadership. The opportunity to influence Robinhood Chain, the Tokenization Engine, and Robinhood Wallet is exactly the kind of high-impact platform mandate I want to own.

In my current role as Staff Software Developer and Enterprise Architect at RBC, I lead complex platform initiatives in a regulated financial environment while staying close to implementation. I designed and led the 0-to-1 production delivery of a patent-pending full-stack platform using Node.js, TypeScript, React, and REST APIs, writing nearly all of its production code and core logic. I also architected an OpenTelemetry-based data platform using Vector, Fluent Bit, Kafka, and Logstash that ingests 150 TB per day across more than 10,000 systems. Those systems demanded the same qualities Robinhood emphasizes: correctness, resilient distributed design, observable operations, secure interfaces, explicit trade-offs, and long-term maintainability.

My Web3 experience is both architectural and hands-on. As HealthCard's first full-stack engineer and blockchain architect, I built React/TypeScript applications, Node.js services, Hyperledger Fabric verification, ERC-20 Solidity contracts, and AWS EKS infrastructure with audit logging. I designed fraud-resistant validation and trust-score workflows, permissioned-ledger data models, token contracts, and gas-optimized Hardhat/Foundry delivery pipelines. The organization grew to more than 20 engineers before acquisition, giving me direct experience establishing the architecture and engineering practices that others later scaled.

Earlier, at CryptoVantage, I built a real-time Ethereum analytics platform in Go and JavaScript with event streaming, wallet clustering, transaction risk scoring, and APIs for 5AMLD-aligned compliance teams. My independent work has included smart contracts, DeFi integrations, and permissioned-ledger systems, and my published DCS-BBN research used Solidity, Hyperledger Fabric, and zk-SNARKs for privacy-preserving distributed storage. I have also built a personal tokenized-asset prototype covering compliant issuance, allowlisted transfers, wallet signing, lifecycle events, indexing, and reconciliation.

At staff level, I lead five engineers across multi-team initiatives, drive HLDs and ADRs, review code and system designs, define reliability and security standards, mentor engineers, and align platform direction with product, risk, security, and architecture leaders. I am also building an LLM + RAG interface that accelerates architecture work through tool integration, evaluation, and secure automation. I would bring the same combination of technical vision, production coding, engineering quality, and force-multiplying leadership to Robinhood's Web3 organization.

Thank you for your consideration. I would welcome the opportunity to help evolve Robinhood Wallet and build secure, reliable tokenization and chain infrastructure that meaningfully broadens access to financial markets.

Best regards,
Dhruv Doshi
