RE: Staff Software Engineer, Platform App Services - Okta

Dear Hiring Team,

I am writing to apply for the Staff Software Engineer, Platform App Services role at Okta. The combination of Go-based backend services, distributed systems, operational excellence, and cross-team platform leadership is a strong fit for the work I have been doing and the kind of engineering I want to continue scaling. I am especially drawn to the opportunity to make platform services simpler, more reliable, and easier for other teams to consume.

At RBC, I have led the 0-to-1 production delivery of a platform that serves internal teams with reusable workflows and secure service integration patterns. I have also driven Terraform-based infrastructure modules across AWS and GCP, standardized OpenTelemetry schemas used by 20+ engineering teams, and partnered closely with product, risk, and architecture stakeholders to keep delivery aligned with operational and governance requirements. Those experiences map closely to the role's emphasis on technical strategy, observability, complexity reduction, and cross-functional influence.

My background also includes hands-on cloud-native delivery in smaller environments. At HealthCard, I was the first engineer and built a full platform from scratch on AWS EKS, including API services, deployment automation, and audit logging. That taught me how to move from ambiguity to production with discipline, how to make tradeoffs visible, and how to keep systems maintainable as they scale. Earlier at Dalhousie, I supported software development and cloud computing courses while doing systems research, which strengthened the low-level reasoning that is useful when backend services need to be dependable under load.

I am attracted to this role because it combines backend architecture with the practical responsibility of mentoring teams, reducing system complexity, and setting standards for reliability. I like working incrementally, getting feedback early, and iterating on solutions until they are operationally sound. I also enjoy the force-multiplier aspect of platform work: improving the experience for many teams by making core services easier to understand, integrate, and operate.

I would welcome the opportunity to bring that mindset to Okta and help build backend platform services that are performant, reliable, and easy to adopt at scale. Thank you for your consideration, and I would be glad to discuss how my background in distributed systems, infrastructure, and developer enablement maps to the team's goals.

Best regards,

Dhruv Doshi
