RE: Staff Software Engineer, Core Service Interfaces (Auth0)

Dear Hiring Team,

I am writing to apply for the Staff Software Engineer, Core Service Interfaces role at Auth0. The combination of customer-facing APIs, backend services, dashboard foundations, and AI-assisted development is a strong fit for the work I have been doing and the kind of platform engineering I want to keep scaling. I am especially drawn to the opportunity to make core services more reliable, consistent, and easy for other teams to build on.

At RBC, I led the 0-to-1 production delivery of a Node.js, TypeScript, and React platform with reusable workflows and secure service integration patterns. I also drove Terraform-based infrastructure modules across AWS and GCP, standardized OpenTelemetry schemas used by more than 20 engineering teams, and partnered closely with product, risk, and architecture stakeholders to keep delivery aligned with operational and governance requirements. That combination of backend delivery, infrastructure work, and cross-functional coordination maps well to a team owning core service interfaces.

My background also includes hands-on delivery in smaller, fast-moving environments. At HealthCard, I was the first engineer and built a full cloud-native platform from scratch on AWS EKS, including API services, deployment automation, and audit logging. Earlier at Dalhousie, I supported software development and advanced cloud computing courses while doing systems research, which reinforced the low-level reasoning that is useful when backend services need to stay dependable under load.

I am particularly interested in this role because it sits at the intersection of API design, operational reliability, and developer experience. I like reducing complexity for teams that depend on shared services, and I value the discipline of reviewing changes carefully, improving testing strategy, and iterating incrementally. I also embrace AI-assisted development tools as part of my workflow, using them to move faster while still applying judgment and rigor.

I would welcome the opportunity to bring that mindset to Auth0 and help strengthen the core backend services that power the Management API and Dashboard. Thank you for your consideration, and I would be glad to discuss how my background in backend systems, infrastructure, and developer enablement maps to the team's goals.

Best regards,

Dhruv Doshi
