RE: AI Full Stack Software Developer, DRW

Dear Hiring Team,

I am writing to apply for the AI Full Stack Software Developer role on DRW's AI and Multi Asset Systematic Strategies team. The role is a strong match for the systems I have been building: AI-enabled internal tooling, scalable RAG workflows, full-stack platforms, and production observability for high-stakes enterprise environments. I am especially drawn to DRW's emphasis on autonomy, curiosity, technical rigor, and moving research-backed ideas into practical tools used by traders, researchers, and engineers.

At RBC, I am building ASB Assist, an LLM + RAG interface on top of an enterprise architecture blueprint platform. The system turns natural-language requirements into compliant architecture diagrams and service recommendations, using LangChain-style orchestration, retrieval patterns, context assembly, prompt/version iteration, citation validation, audit trails, and safety controls. That work maps closely to DRW's need for efficient RAG systems and LLM evaluation frameworks that can measure quality, catch regressions, and support reliable internal adoption.

I also led the 0-to-1 production delivery of the underlying full-stack platform using Node.js, TypeScript, React, and secure service integrations. It includes real-time data rendering, rules-based recommendations, auto-certification workflows, and production handoff patterns for regulated teams. In parallel, I architected RBC's telemetry platform using OpenTelemetry, Vector, Fluent Bit, Kafka, and Logstash, ingesting 150 TB/day across 10,000+ systems. That experience gives me hands-on depth in distributed systems, monitoring, alerting, log analysis, SLOs, and production debugging.

Before RBC, I was the first engineer at HealthCard, where I built a healthcare and insurance-adjacent platform from scratch: React/TypeScript frontend, Node.js/Express APIs, AWS EKS deployment, Hyperledger Fabric verification, transformer-based document classification, and HIPAA-aligned audit logging. I also have personal project experience in trading and optimization, including a sub-second trading algorithm using live brokerage APIs and real-time market data streams, as well as reinforcement-learning pricing work in Python.

DRW's culture of challenging consensus and building sophisticated technology with real ownership is exactly the kind of environment where I can contribute. I would welcome the opportunity to bring my experience in Python, Go, TypeScript, RAG systems, LLM evaluation, distributed data platforms, and production reliability to the AI and Multi Asset Systematic Strategies team.

Best regards,

Dhruv Doshi
