RE: Full Stack Software Developer, DRW

Dear Hiring Team,

I am writing to apply for the Full Stack Software Developer role at DRW in Montreal. The role stands out because it combines the parts of software engineering I enjoy most: building critical internal tools, working directly with sophisticated users, turning ambiguous requirements into reliable systems, and owning software from design through production. DRW's culture of autonomy, technical rigor, and challenging consensus is a strong match for how I approach engineering.

At RBC, I led the 0-to-1 production delivery of a patent-pending enterprise blueprint platform using Node.js, TypeScript, React, REST APIs, real-time data rendering, rules-based recommendations, auto-certification workflows, and secure service matching. The platform is used by engineering, architecture, infrastructure, security, risk, and product stakeholders to analyze requirements, compare implementation options, and generate compliant technical artifacts. That experience maps closely to DRW's need for tooling that helps traders, researchers, and engineers implement and analyze complex strategies.

I also bring strong backend and platform experience. I architected RBC's telemetry platform using OpenTelemetry, Vector, Fluent Bit, Kafka, and Logstash, ingesting 150 TB/day across 10,000+ systems. That work required practical distributed-systems judgment around schemas, event pipelines, tracing, alerting, SLOs, production debugging, operational handoff, and maintainable documentation. I also led five engineers through technical planning, design reviews, code reviews, ADRs, runbooks, and production-readiness discussions.

Before RBC, I was the first engineer at HealthCard, where I built a healthcare and insurance-adjacent platform from scratch: React/TypeScript frontend, Node.js/Express APIs, AWS EKS deployment, Hyperledger Fabric verification, audit logging, and secure workflow automation. I have also built personal quantitative projects including a sub-second trading algorithm using live brokerage APIs and real-time market data streams, plus a Python portfolio risk optimization framework with backtesting, Monte Carlo simulation, and risk-adjusted signal evaluation.

I would welcome the opportunity to bring my experience in TypeScript, React, Node.js, Python, Go, relational databases, Redis-style caching, event-driven systems, Docker/Kubernetes, testing, and production operations to DRW's technology team. Thank you for your consideration, and I would be glad to discuss how my full-stack and platform background can support the tools used by DRW's traders, researchers, and engineers.

Best regards,

Dhruv Doshi
