RE: Senior Forward Deployed Engineer - Okta for AI Agents

Dear Hiring Team,

I am writing to apply for the Senior Forward Deployed Engineer role on Okta for AI Agents. The combination of hands-on delivery, agent identity, and customer-embedded deployment work is a strong fit for how I like to operate: close to the code, close to the customer problem, and focused on shipping secure systems that teams can actually run in production.

At RBC, I led the 0-to-1 production delivery of a platform that turns enterprise architecture requirements into executable, compliant outputs. More recently, I have been building ASB Assist, a natural-language architecture layer that uses MCP gateway and agent-gateway patterns together with LLMs, RAG, OAuth, and Zero-Trust controls. That experience has taught me how to move from prototype to usable system while keeping identity, delegation, and auditability central to the design.

I also bring a strong foundation in cloud-native implementation and operational discipline. At HealthCard, I was the first engineer and built the product from scratch on AWS EKS, including API services, deployment automation, and HIPAA-compliant audit logging. Across RBC I have driven Terraform-based infrastructure modules, standardized OpenTelemetry across 20+ teams, and worked with cross-functional stakeholders to improve reliability, troubleshooting, and rollout consistency.

What interests me most about this role is the customer-facing nature of the work. I am comfortable translating technical systems into practical decisions for engineers and senior stakeholders, and I enjoy working through messy integration details until the system is real and defensible. I value ownership, incremental delivery, and clear communication, especially when the work involves security, governance, and production risk.

I would welcome the chance to help Okta customers deploy secure AI agents with strong identity and authorization boundaries, and to feed field learnings back into product improvements that scale across the broader platform. Thank you for your consideration, and I would be glad to discuss how my background maps to the team's needs.

Best regards,

Dhruv Doshi
