RE: Staff AI Engineer, Acquia

Dear Hiring Manager,

I am applying for the Staff AI Engineer role on Acquia's AI Core Engineering team. The opportunity to remain a hands-on contributor while establishing reliable agent patterns for an enterprise platform strongly matches how I work today: building systems directly, making architectural trade-offs explicit, and helping other engineers raise the quality of their implementations. I am especially drawn to Acquia's focus on agentic workflows that orchestrate action within enterprise governance guardrails.

At RBC, I am building ASB Assist, an LLM and retrieval-augmented generation layer that turns natural-language requirements into compliant architecture diagrams and enterprise service recommendations. The work spans retrieval, prompt and context engineering, orchestration, security controls, evaluations, and audit trails. ASB Assist remains in development, and it builds on a production foundation I designed and shipped: a patent-pending Node.js, TypeScript, and React platform with rules-based recommendations, real-time rendering, and automated certification. I wrote 99.6% of that platform's production code and all of its core logic across more than 1,000 architecture patterns.

I also bring the reliability and observability perspective required to move AI workflows beyond prototypes. I architected a general-purpose OpenTelemetry platform using Vector, Fluent Bit, Kafka, and Logstash that ingests 150 TB per day across more than 10,000 systems. The platform standardized schemas and vendor-neutral onboarding for over 20 engineering teams. While this is not dedicated LLM observability, the underlying work in tracing, operational standards, high-throughput pipelines, and failure-aware design is directly relevant to building dependable AI systems and evaluating new observability tooling.

My broader experience combines applied AI, cloud delivery, and enterprise governance. As HealthCard's first full-stack engineer, I integrated transformer-based document classification into insurance and credential-verification workflows and built the surrounding product on AWS EKS. At RBC, I operationalized a Responsible AI framework across AWS, GCP, and OpenShift. I currently lead five engineers through hands-on design, implementation, code reviews, ADRs, and mentoring while aligning product, security, risk, and architecture stakeholders.

I would welcome the opportunity to bring this combination of hands-on AI engineering, large-scale platform reliability, and pragmatic technical leadership to Acquia as it builds agent-ready digital experiences for enterprise customers. Thank you for your consideration.

Best regards,
Dhruv Doshi
