RE: Staff Software Engineer, Backend, Cresta

Dear Hiring Manager,

I am applying for the Staff Software Engineer, Backend role at Cresta. The opportunity to shape distributed backend systems for enterprise AI agents closely matches my work leading platform architecture, high-volume data infrastructure, and production engineering in a regulated environment. I bring hands-on system design and delivery experience alongside the staff-level responsibility of guiding engineers and aligning technical decisions across teams.

At RBC, I architected an institution-wide observability and data platform built with Vector, Fluent Bit, Kafka, and Logstash. It ingests 150 TB per day across more than 10,000 systems and replaces point-to-point vendor integrations with configurable data paths. I also defined OpenTelemetry schemas, collection pipelines, and SDK onboarding guidance adopted by more than 20 engineering teams. This work required careful reasoning about throughput, failure isolation, schema contracts, operability, and long-term platform evolution, the same fundamentals behind reliable, high-volume backend services.

I also designed and led the 0-to-1 production delivery of a patent-pending Node.js and TypeScript architecture platform. I wrote 99.6% of its production code and all core logic for service matching, real-time rendering, and rules-based auto-certification. Building the platform in air-gapped, security-constrained environments sharpened my approach to API design, secure integrations, deployment reliability, and pragmatic architectural trade-offs. I am now extending it through ASB Assist, an LLM + RAG interface under development that converts natural-language requirements into compliant architecture diagrams and enterprise service recommendations. That work gives me direct experience collaborating at the boundary between AI capabilities and the deterministic systems that make them usable and governable.

Earlier, as HealthCard's first full-stack engineer, I built Node.js/Express APIs and deployed containerized workloads on AWS EKS with HIPAA-compliant data handling and audit logging. The team grew to more than 20 engineers before acquisition. Across these roles, I have owned systems from design through production, built CI/CD and observability into delivery, and worked across cloud, security, product, and architecture concerns.

Today I lead five engineers through technical planning, ADRs, code and design reviews, mentorship, sprint execution, and production handoff. I would welcome the chance to bring that combination of hands-on backend engineering, distributed-systems judgment, and cross-team leadership to Cresta as it scales the runtime infrastructure behind its AI platform.

Thank you for your consideration. I look forward to discussing how I can contribute to Cresta's backend architecture and production excellence.

Best regards,
Dhruv Doshi
