RE: Customer Experience Engineer, CXE-T – Docker

Dear Hiring Manager,

I am applying for Docker's Customer Experience Engineer, CXE-T role. My background combines hands-on platform engineering, applied architecture guidance, cloud-native delivery, and technical enablement in complex enterprise environments. The opportunity to turn deep technical expertise into reusable sessions, reference patterns, and adoption frameworks is closely aligned with how I work: solve a difficult platform problem once, codify the solution, and help engineering teams apply it consistently.

At RBC, I designed and led the 0-to-1 production delivery of an architecture enablement platform that maps more than 1,000 security, integration, infrastructure, and deployment patterns to compliant component selections. The platform gives engineers practical guidance while automating certification workflows in a highly constrained environment. I also work directly with principal architects, product, engineering, and risk stakeholders to translate requirements into designs that teams can implement. That combination of building and advising is well suited to Docker's need for a technical authority who can scale adoption without losing architectural depth.

My strongest example of reusable enablement is RBC's OpenTelemetry standardization. I defined schema contracts, collection patterns, and SDK onboarding guides adopted by more than 20 engineering teams. In parallel, I architected a vendor-neutral logging platform processing 150 TB per day across 10,000+ systems. These initiatives required me to make complex platform behavior understandable, create repeatable implementation paths, and surface recurring engineering friction. As a former teaching assistant for Software Development, Algorithms, and graduate Advanced Cloud Computing, I also bring formal experience explaining technical concepts to audiences with different levels of maturity.

I have built and operated containerized systems directly. As HealthCard's first engineer, I delivered a React and Node.js product on AWS EKS with audit logging and regulated data-handling controls, then implemented CI/CD for its smart-contract components. At RBC, I am also building an LLM and RAG architecture assistant that incorporates Zero-Trust, OAuth, MCP gateway, and agent gateway patterns; I would bring an honest, implementation-oriented perspective to Docker's emerging agent governance work.

I would welcome the opportunity to help Docker customers move from initial adoption to secure, repeatable platform practices through technical sessions, reusable environments, and clear architectural guidance. Thank you for your consideration. I look forward to discussing how my platform engineering, enablement, and governance experience can support Docker's customer community.

Best regards,
Dhruv Doshi
