RE: Senior Technical Solutions Architect, Fidelity Clearing Canada

Dear Fidelity Canada Hiring Team,

I am applying for the Senior Technical Solutions Architect position with Fidelity Clearing Canada. In my current role at RBC, I combine enterprise architecture leadership with hands-on platform delivery in a regulated financial-services environment. I translate business objectives into target-state designs, make dependencies and trade-offs clear to senior stakeholders, and guide complex solutions through architecture, security, and delivery governance.

Within RBC's Enterprise Architecture group, I define solution standards, security controls, reference architectures, and certification practices across application, integration, and infrastructure domains. I designed and led the 0-to-1 production delivery of a patent-pending architecture blueprint platform built with Node.js, TypeScript, React, and REST APIs. Its rules-based recommendation and auto-certification workflows map more than 1,000 architecture patterns to compliant component selections, helping teams move from requirements to reviewable solution designs with consistent governance.

My work regularly involves the integration touchpoints central to this role: APIs and gateways, IAM, OAuth, SSO, Zero Trust, cloud and on-premise connectivity, event-driven systems, resiliency, data handling, and external service dependencies. I also digitalised RBC's technical reference model, cataloguing more than 1,000 technologies and 1,500 capabilities with standards and ownership metadata. That work connects architecture decisions to technology roadmaps, modernization priorities, and accountable governance.

I have also architected high-scale operational platforms. An OpenTelemetry-based design using Vector, Fluent Bit, Kafka, and Logstash now ingests 150 TB of telemetry per day across more than 10,000 systems. The architecture replaced point-to-point vendor integrations with standardised, auditable routing and made vendor changes a configuration decision. Earlier, as the first engineer at HealthCard, I owned application, API, security, and AWS EKS infrastructure decisions for a secure 0-to-1 product. These experiences strengthened my judgment around complex dependencies, implementation risk, and pragmatic delivery.

Alongside the technical work, I lead five engineers through architecture and code reviews, ADRs, sprint planning, risk decisions, mentoring, and executive-ready demonstrations. I work closely with product, engineering, infrastructure, risk, and security stakeholders to build alignment without losing sight of timelines or operational requirements. Fidelity Clearing Canada's combination of brokerage technology, enterprise integration, and architecture governance is a compelling setting for that experience.

Thank you for your consideration. I would welcome the opportunity to discuss how my financial-services architecture background, hands-on engineering depth, and cross-functional leadership can support FCC's technology strategy and solution portfolio.

Best regards,
Dhruv Doshi
