RE: VP, Engineering, Rewind

Dear Rewind Hiring Team,

I am applying for the VP, Engineering role at Rewind. Your need for a hands-on technology leader who can connect architecture, cloud reliability, security, engineering execution, and customer outcomes is closely aligned with how I operate today. Based in Toronto, I bring experience building regulated, data-intensive platforms, setting enterprise technology patterns, and leading engineers through complex delivery while remaining directly involved in design and code.

At RBC, I designed and led the 0-to-1 production delivery of a patent-pending architecture blueprint platform using Node.js, TypeScript, and React. Its rules-based recommendation and auto-certification workflows map more than 1,000 architecture patterns to compliant service selections. The work requires a clear product and architecture direction, rapid execution in an air-gapped environment, and close alignment across engineering, product, risk, security, and senior architecture stakeholders. I lead five engineers through sprint planning, hands-on reviews, ADRs, mentorship, and executive demonstrations.

I have also designed infrastructure where reliability and data integrity are fundamental. I architected an OpenTelemetry-based platform using Vector, Fluent Bit, Kafka, and Logstash that ingests 150 TB of telemetry per day across more than 10,000 systems. Standardized pipelines replaced point-to-point vendor integrations, made routing changes configuration-driven, and improved auditability while lowering integration complexity and operational cost. Earlier, as HealthCard's first full-stack engineer, I built a secure cloud-native product from scratch on AWS EKS; the team grew to more than 20 engineers before the company was acquired.

Security and responsible technology governance are equally central to my work. I defined an enterprise AI governance framework spanning model risk, IAM, audit trails, OSFI and GDPR considerations, and sovereign-AI constraints across AWS, GCP, and OCP. I am also building ASB Assist, an LLM-and-RAG interface for generating compliant architecture recommendations from natural-language requirements. This combination has given me practical experience applying AI to engineering work while preserving the controls demanded by sensitive customer data.

Rewind's mission is compelling because backup and recovery turn engineering quality into a direct promise to customers. I would welcome the opportunity to discuss how my experience in hands-on technology strategy, high-scale cloud platforms, security governance, startup product delivery, and accountable team leadership could support Rewind's next stage.

Best regards,
Dhruv Doshi
