RE: Staff Software Engineer, Link

Dear Stripe Hiring Team,

I am applying for the Staff Software Engineer role on Link in Toronto. The opportunity to turn an established checkout network into a trusted consumer financial platform strongly matches the work I do best: taking ambiguous product and technical problems from definition through launch, building across backend services and user experiences, and making reliability, security, and operational judgment part of the architecture from the beginning.

At RBC, I designed and led the 0-to-1 production delivery of a patent-pending architecture platform using Node.js, TypeScript, React, and REST APIs. I wrote 99.6% of its production code and all core logic, translating complex requirements into real-time rendering, rules-based recommendation, and auto-certification workflows. That work required an incremental technical plan, clear API and data contracts, architecture decision records, careful rollout decisions, and continuous alignment with engineering, product, risk, security, infrastructure, and senior architecture stakeholders.

I also architected a vendor-agnostic OpenTelemetry platform that ingests 150 TB per day across more than 10,000 systems using Vector, Fluent Bit, Kafka, and Logstash. Replacing point-to-point integrations with standardized, auditable pipelines strengthened my judgment around failure modes, resiliency, observability, safe change, and maintainable foundations at financial-institution scale. I bring the same operational discipline to hands-on delivery, including code and design reviews, IAM and Zero-Trust patterns, cloud deployment, and production readiness.

My earlier work provides adjacent experience for Link Balance's digital-dollar direction. As HealthCard's first full-stack engineer and blockchain architect, I built a pre-insurance payment product from scratch with React/TypeScript, Node.js APIs, Hyperledger Fabric verification, ERC-20 contracts, and AWS EKS infrastructure with HIPAA-aligned audit controls. At CryptoVantage, I built real-time Ethereum event processing and transaction-risk workflows in Go and JavaScript for 5AMLD-aligned compliance use cases. These roles taught me to treat transaction correctness, fraud resistance, privacy, and user trust as product requirements, not afterthoughts.

I currently lead five engineers through execution while remaining hands-on in implementation, code and design reviews, mentoring, risk management, and stakeholder communication. I would welcome the opportunity to bring this combination of full-stack product ownership, regulated-system architecture, distributed-systems reliability, and blockchain foundations to Link as Stripe develops safe and intuitive global money-movement capabilities.

Thank you for your consideration. I would be glad to discuss how my experience can contribute to Link's next stage of growth.

Best regards,
Dhruv Doshi
