RE: Senior Software Engineer, Platform Network (Auth0), Okta

Dear Hiring Team,

I am writing to apply for the Senior Software Engineer, Platform Network role at Auth0 by Okta. The combination of global-scale connectivity, cross-team infrastructure work, and self-service tooling is a strong fit for the kind of platform engineering I enjoy most. I am especially interested in building reliable systems that make authentication and authorization safer and easier for other engineers to consume.

In my current role at RBC, I have led platform delivery across cloud-native services, Terraform-based infrastructure, and reusable integration patterns spanning AWS and GCP. One of my most relevant efforts was standardizing OpenTelemetry schemas and onboarding guides across 20+ engineering teams, which improved operational visibility and gave downstream teams a consistent foundation for troubleshooting and alerting. I have also driven reusable infrastructure modules that reduced point-to-point integrations and made platform behavior more predictable for consumers.

My background also includes hands-on service delivery in smaller, fast-moving environments. At HealthCard, I was the first engineer and built a full cloud-native stack from scratch on AWS EKS, including API services, deployment automation, and audit logging. Earlier at Dalhousie, I supported advanced cloud computing and software development courses as a teaching assistant while working on research that required low-level systems reasoning. That mix of practical implementation, systems thinking, and incremental delivery maps well to a role where reliability, maintainability, and detail matter.

I am drawn to the Platform Network team because it sits at the intersection of infrastructure, security, and product mindset. I like building internal tooling that is documented, reusable, and easy for application teams to adopt, and I am comfortable working across design reviews, code reviews, and operational follow-through. I also value the kind of ownership and accountability that comes with supporting highly reliable systems in production.

I would welcome the chance to contribute to Auth0's network platform work and help build the tooling and infrastructure that keep identity services reliable at global scale. Thank you for your consideration, and I would be glad to discuss how my background in cloud platforms, Terraform, observability, and developer enablement maps to the team's needs.

Best regards,

Dhruv Doshi
