RE: Software Architect (Auth0), Okta

Dear Hiring Team,

I am writing to apply for the Software Architect (Auth0) role on your careers site. I am Toronto-based and drawn to the combination of hands-on prototyping, identity architecture, and industry-shaping protocol work described in the posting. The chance to help solve authorization for agents, strengthen phishing-resistant identity flows, and turn emerging standards into usable samples and SDKs is exactly the kind of work I want to do.

In my current role at RBC, I led the 0-to-1 delivery of an enterprise architecture blueprint platform that maps more than 1,000 architecture patterns to compliant component selections. More recently I have been building an ASB Assist layer that lets users describe requirements in chat and generates compliant architectures using MCP gateway and agent-gateway patterns, with OAuth, Zero-Trust, and security controls injected into the flow. That work has required me to move quickly from concept to production-minded proof of concept, while keeping the architecture simple enough for engineers to use and trust.

I also bring a strong identity and platform background from prior work. At HealthCard, I was the first engineer on a pre-insurance payment platform and built the React, Node.js, and Hyperledger Fabric stack from scratch, including audit logging and a fraud-resistant validation algorithm. At RBC I have also helped standardize OpenTelemetry and reusable onboarding guides across 20+ teams, which is the same kind of developer-enablement mindset that makes samples, SDKs, and reference implementations successful in practice.

What makes this opportunity especially compelling is the mix of technical depth and external influence. I enjoy working across architecture, security, and product teams, translating a fuzzy problem space into practical design choices, and then iterating based on feedback from engineers and stakeholders. I have led small teams hands-on, written ADRs, run code reviews, and aligned delivery with risk and platform partners, so I am comfortable operating at the point where strategy meets implementation.

I would welcome the opportunity to bring that combination of identity, cloud, developer tooling, and architecture experience to Okta and Auth0. I am excited by the possibility of helping shape how builders authenticate people and agents safely, and I would be glad to discuss how my background maps to the team's current work.

Best regards,

Dhruv Doshi
